

SCHOOL OF ARTS EXHIBITION.

The exhibition at the School of Arts was on Saturday as well attended as upon any previous day, many availing themselves of the half-holiday to inspect the works of art and industry, and also the numerous models and scientific apparatus. The receipts for the day amounted to £33 13s. and the number of visitors, including those admitted by season ticket, was 1,000. The exhibition is well arranged, and the evening Mr. Ryall performed upon the piano-forte and the harmonium; arrangements have, we understand, been made by this gentleman's services will be continued during the afternoon and evening of each day this week. Mr. Bell again explained his model railway to a large number of persons, who expressed much interest in the invention. To-day a circular railway and some other working models will be added to the exhibition, besides an engraving of Holman Hunt's celebrated picture, "Light of the World," and five photographs of cartoons.

Owing to the absence of the information which the publication of the catalogue would have supplied we have hitherto been prevented from giving a description of the paintings and other works of art. We subjoin a notice of a few of the more remarkable curiosities, models, and scientific apparatus.

One of the curiosities of greatest interest is a relic of "Britannia's god of war." A coat that was worn by Lord Nelson—part of his naval uniform—is exhibited by Mr. H. W. Wright, of Hastings, who acquired the garment in which he lost his right arm, at the battle of Trafalgar. It is a coat of arms, and is a relic of the coat of arms of the British Empire. It is a coat of arms, and is a relic of the coat of arms of the British Empire. It is a coat of arms, and is a relic of the coat of arms of the British Empire.

In the same case are some interesting relics of Sir John Lenthall, Bart., of the House of Commons, during the Long Parliament and also during the Rump Parliament, exhibited by Dr. Walker. Lenthall's last will and testament is exhibited in a good state of preservation, together with a leather which belonged to him—both relics being preserved by the same person. There are also shown the sacramental cup belonging to the House of Commons in the time of Oliver Cromwell, and a gaudet presented by Charles I. to Lenthall, by the side of which is a young man struck in commemoration of the battle of Trafalgar. A genuine picture by Sir Joshua Reynolds—a portrait of himself—completes this group of curiosities.

In addition to the above, the exhibition contains a specimen of Tuse, the fabric worn in Manila, from the fibre of a species of banana; and also a landerker made of Pina, a fabric woven in Manila from the fibre of the same plant, and considered by good men. Both fabrics are extremely delicate and beautiful.

Messrs. Drush and MacDonnell exhibit several valuable articles in silver work, and also some philosophical apparatus. The principles of the various instruments are explained in a small book, which is a valuable curiosity, amongst which are a real diamond found at Pyramid Creek, a piece of leadstone, and some artificial human eyes, and the exhibition of the above items have also been sent to the exhibition the work of the Sydney University which they manufactured, and a very elegant silver jug, in the Italian style of the 16th century.

A cup, made out of an egg-shaped with silver, and with silver figures of volantes, with their impellers round the stem—adapted for one of the prizes to be given for the best shot—is exhibited by Mr. J. Hamilton, of Chippendale, exhibits some beautiful crystals, the peculiar formation and the rich colours of which attract much attention; and also some of the most beautiful specimens of minerals, and a very beautiful paper. A section of a petrified gum tree, from the same exhibitor, is also a curious formation.

A recently executed water line model is exhibited by Mr. Cuthbert, of a steamer of about 150 tons, adapted for rivers and shallow water, the draught being only three feet. The cabin, of which there could be two, is fitted up with a complete set of furniture, and the model is being prepared by the steam draught of the Sydney University. Mr. Cuthbert is constructing, and will be exhibited in a day or two. By the side of the above model are two pieces of wood—one a random chip of blue pine, and the other a piece of white pine, which are the specimens are exhibited to show the superiority of colonial hardwood to other kinds of wood, not being subject to rot.

A model of a species of shipwreck, there is a considerable variety. Many of these are accompanied by any explanation; but whether these are given in the catalogue or not there ought to be cards stating what the objects are, and the names of the exhibitors. The sea and also figures on the deck being ingeniously represented. There is a very neat model of a three-decker, exhibited by Mr. E. Hamilton, and a model of a schooner, exhibited by Mr. J. Hamilton. There is also an ivory model of a barque, without any name attached. A recent model shows Dr. Bland's invention for the propulsion of a steamship by means of a screw propeller. Some mechanical pipes are exhibited, manufactured by Mr. F. Field, of Parramatta-street, from a block of genuine merschaum found at the Richmond.

A sample of silk, spun by Australian spinnings, is very curious. The fibre is soft and glossy, and might not be thought for textile purposes if produced in such quantity. The specimen is exhibited by Mr. R. W. Hind, of the Sydney University. In the gallery of the hall is exhibited a model of a block of houses in Edinburgh, in one of which John Brown, the Reformer, was born. The model is a very interesting one, and is a complete reproduction of the original, with the minutest accuracy. It is a model of a block of houses in Edinburgh, in one of which John Brown, the Reformer, was born. The model is a very interesting one, and is a complete reproduction of the original, with the minutest accuracy. It is a model of a block of houses in Edinburgh, in one of which John Brown, the Reformer, was born. The model is a very interesting one, and is a complete reproduction of the original, with the minutest accuracy.

An ingenious toy—called a delectoscope—affords a great deal of surprise and amusement to the younger boys. Its construction is very simple, consisting of a small cardboard frame, in which are two mirrors placed at an angle of 45 degrees, and a small piece of glass, with coloured lines or figurative drawings on them, apparently at random. Looked at by the eye, they present no regular figure, but placed before the microscope, the various colours and lines are brought out, and the result is a very beautiful and interesting picture. The principle of the instrument is the same as that of the kaleidoscope, and is a very simple and ingenious one.

One of the most extraordinary objects in the entire collection is a tortoise and the fragments of the tortoise, which were exhibited by Mr. Keene, the eminent Inspector-General. The tortoise was a large one, and had been living for a number of years, and its death having been a long and painful one, it was a very interesting specimen. The tortoise was a large one, and had been living for a number of years, and its death having been a long and painful one, it was a very interesting specimen. The tortoise was a large one, and had been living for a number of years, and its death having been a long and painful one, it was a very interesting specimen.

The tortoise was a large one, and had been living for a number of years, and its death having been a long and painful one, it was a very interesting specimen.

that such creatures can exist in a torpid state, for it is not difficult, he says, to find evidence that they absorb sufficient air through the lungs, and in both these cases the rocks are permeable, and has been from the time of the invention permeated by water like a sponge, and thus the moisture penetrating to the cavity may have been sufficient to maintain such a condition of existence as the creature requires. It would be an error to suppose that these reptiles require for their existence the support of human life, and if they could thus live for five years, they may continue to live for five millions of years. If we cease to make a wonder of it, there is little difficulty in comprehending it. They torpidly slept three days after being taken; it was injured in the breaking of the rock. I examined the strata, and had the tortoise and fragments given to me soon after their discovery in both cases. W. Keene, Esq., who was present, was of the opinion that the tortoise was a large one, and had been living for a number of years, and its death having been a long and painful one, it was a very interesting specimen.

An electrifying machine, of very large size and power, was sent to the exhibition on Friday. It was made by Mr. W. James, of Dowling-street, and belongs to Mr. W. S. Greeny. The diameter of the glass plate is about forty-two inches. We understand that it will be brought into use this evening, when visitors will have an opportunity of testing its power.

DARLINGHURST MUTUAL IMPROVEMENT SOCIETY.—A short time since, a society was formed in the wealthy and populous district of Darlinghurst, having for its object the supply of means for intellectual and moral improvement among the inhabitants of the parish. The first step towards carrying out this object has been taken by the opening of an excellent reading-room, situated in William-street, between Bourke and Forbes streets, and near the corner of the parish. The room is a large one, and is open to members from eight a.m. to half-past nine p.m., and is supplied with a capital collection of periodicals. In the evening it is brilliantly lighted with gas, and is a most comfortable place for reading and study.

CHURCH OF ENGLAND TEACHERS' ASSOCIATION.

The usual monthly meeting of the members of the above association was held on Saturday last, 2nd instant, in St. James' school. Present—eighteen members. Mr. Coburn, in the chair. After the usual business, the chairman called on Mr. Whitehead to give a lesson on the "Early History of Great Britain" to a class of boys, pupils from several schools, who had met for the purpose of giving the gentlemen the opportunity of showing his method, &c., of teaching history. In the interesting lesson which followed, Mr. Whitehead explained how and by whom Great Britain was first inhabited, and the names of the various nations, and also gave an account of the invasion of Britain by the Romans, mentioning many principal changes and events, and dwelling somewhat minutely on the character of those whose names and deeds have descended to our time, from which he drew some excellent lessons, which not only the pupils, but their teacher, hearsers, will do well to remember and act up to. After the criticism of the lesson, two names were elected, one as teacher, and one as monitor. The secretary then announced that at the next meeting the discussion would be, "How to give a lesson." To be opened by Mr. Coburn. After a vote of thanks to Mr. Whitehead, the meeting terminated, as usual, with singing the doxology.

PROGRESS OF THE MILITARY.—We learn from a gentleman who returned from Hermon on Saturday morning that the troops who were sent to the Flat arrived at Martin's Inn, at Bargo, on Friday afternoon, at two o'clock. They had then made only about seventy miles of their journey.

THE GREAT NORTH-WEST ISLAND MEN.—We mentioned in our issue of Saturday that it was intended to send back to Cockatoo Island seventy of the prisoners who were received there on the 20th of last month. It was then stated that the prisoners were to be sent back to Cockatoo Island, and that the prisoners were to be sent back to Cockatoo Island, and that the prisoners were to be sent back to Cockatoo Island.
